

The SAFE Program: Systematic Approach to a Fall-Safe Environment

Falls occurring among visitors at healthcare facilities can stem from various modifiable environmental factors such as the condition of buildings, furnishings, and outdoor areas. These falls may lead to serious injuries for visitors, staff, and patients as well as financial challenges for healthcare organizations.

SAFE is an easy to use, guideline driven assessment that helps you address environmental contributors to fall events.

HD Nursing is an evidence-based safety solutions company. We are dedicated to improving patient safety and injury management across the continuum of care.

Key Program Elements

Assess

Facilities assess for fall risk quarterly. Surveyors compare the physical environment with a tested and reviewed standard. Photos of deficiencies are uploaded to the Program.

Review

Program Administrators review deficiencies reported by surveyors and determine the priority and timeline for correction.

Communicate

Program Administrators export Program reports to their Facility Manager for follow up and correction.
